

Meet the new Guard Range from Sollatek

Now with iSense™ technology

iSense allows you to set the desired level of protection, depending on the stability of your mains supply.

High setting

Low setting

L Low setting ensures more working time, as it will tolerate wider acceptable voltage limits.

This is ideal for users with more erratic mains supply. This setting provides a wider window of acceptable voltage limits.

H High setting ensures greater protection, by narrowing the acceptable voltage limits.

This is ideal for users with less erratic mains supply that require better protection, typically in main cities where the power supply is fairly stable.
